

Documents for the AI Era

From files to knowledge

Documents contain some of the most valuable information in the world. Reports, research papers, contracts, invoices, manuals, and books hold knowledge that people understand naturally—but software often sees as little more than a file.

Paperful turns documents into infrastructure that applications and AI can actually use.

Upload a document once and Paperful handles the work behind the scenes. Pages are processed, text is recognized, layouts are understood, and elements such as headings, paragraphs, tables, images, and charts become part of a structured representation of the document.

Instead of building and maintaining separate OCR, parsing, storage, indexing, and AI pipelines, developers can work with one simple platform designed around documents from the beginning.

Structure matters

A document is more than a sequence of characters. A title has a different meaning from a paragraph. A table has relationships between rows and columns. An image may contain information that never appears in the surrounding text.

Paperful preserves this structure through the Paper Graph. Every meaningful part of a document becomes a node that can be retrieved, searched, referenced, and used by applications.

This makes documents useful beyond simple text extraction. Applications can navigate their structure, retrieve precise sections, build better context for language models, and trace information back to the original page.

“Upload a document. Get structured, searchable knowledge ready for humans, applications, and AI.”
